

Data Recovery

What to do when you can no longer access the data on your Hard Drive

• Is Your Computer Slowing Down?

One major sign that your hard drive is near the end of its life is that the computer performance will greatly decrease. Sometimes freezing for several seconds at a time while the Hard Drive works hard to access data in a failing sector.

• Data Recovery that Works

Our Data Recovery software scrutinizes every square inch of your hard disk, looking for areas that are failing. It will determine if sectors are bad and attempt to repair them. If it cannot repair them, it will then relocate the data from the failing sectors to good sectors. It will also keep the hard drive from writing to the bad sectors in the future.

• How it Saves You Money

Our recovery software can recover data on most drives automatically - without the need for a "clean room" environment, and without needing to disassemble the drive. As a result, most of the time-consuming hands-on work is taken out of the process, making it less expensive and saving you money.

A Hard Drive with multiple failing sectors that are being recovered
